

DIOPHANTINE APPROXIMATION WITH SIGN CONSTRAINTS

DAMIEN ROY

ABSTRACT. Let α and β be real numbers such that $1, \alpha$ and β are linearly independent over \mathbb{Q} . A classical result of Dirichlet asserts that there are infinitely many triples of integers (x_0, x_1, x_2) such that $|x_0 + \alpha x_1 + \beta x_2| < \max\{|x_1|, |x_2|\}^{-2}$. In 1976, W. M. Schmidt asked what can be said under the restriction that x_1 and x_2 be positive. Upon denoting by $\gamma \cong 1.618$ the golden ratio, he proved that there are triples $(x_0, x_1, x_2) \in \mathbb{Z}^3$ with $x_1, x_2 > 0$ for which the product $|x_0 + \alpha x_1 + \beta x_2| \max\{|x_1|, |x_2|\}^\gamma$ is arbitrarily small. Although Schmidt later conjectured that γ can be replaced by any number smaller than 2, N. Moshchevitin proved very recently that it cannot be replaced by a number larger than 1.947. In this paper, we present a construction showing that the result of Schmidt is in fact optimal.

1. INTRODUCTION

Given $\alpha, \beta \in \mathbb{R}$, a well-known result of Dirichlet asserts that, for each $X \geq 1$, there exists a non-zero point $(x_0, x_1, x_2) \in \mathbb{Z}^3$ which satisfies

$$|x_0 + x_1\alpha + x_2\beta| \leq X^{-2}, \quad |x_1| \leq X, \quad |x_2| \leq X$$

(see for example [5, Chap. II, Theorem 1A]). In 1976, on the occasion of E. Hlawka's sixtieth birthday, W. M. Schmidt proved a variation of this result in which the coordinates x_1 and x_2 are required to be positive [4]. Upon denoting by

$$\gamma = \frac{1 + \sqrt{5}}{2} \cong 1.618$$

the golden ratio, his result can be stated as follows.

Theorem A (Schmidt). *Let $\alpha, \beta \in \mathbb{R}$ and let $\epsilon > 0$. Suppose that $1, \alpha, \beta$ are linearly independent over \mathbb{Q} . Then, there are arbitrarily large values of X for which the inequalities*

$$|x_0 + x_1\alpha + x_2\beta| \leq \epsilon X^{-\gamma}, \quad 0 < x_1 \leq X, \quad 0 < x_2 \leq X$$

admit a solution $(x_0, x_1, x_2) \in \mathbb{Z}^3$.

In [4], Schmidt made several comments on this result. First, he gave an example showing that it is false without the condition that $1, \alpha, \beta$ are linearly independent over \mathbb{Q} . He also added a remark about the general situation involving a larger number of variables x_0, \dots, x_k .

This was further studied by P. Thurnheer in [7]. Finally, he asked if the exponent γ can be replaced by a larger number without invalidating the statement of Theorem A. Then, several years later, he conjectured in [6] that any number smaller than 2 would do. This conjecture was recently disproved by N. Moshchevitin who showed in [1] by a nice geometric construction that the statement of Theorem A becomes false if γ is replaced by any number larger than 1.947, or more precisely by any number larger than the largest real root of $t^4 - 2t^2 - 4t + 1$. In this paper, we show that, in fact, the exponent γ in Theorem A is already optimal.

2. MAIN RESULT AND NOTATION

For any $\mathbf{x}, \mathbf{y} \in \mathbb{R}^3$, we denote by $\mathbf{x} \cdot \mathbf{y} \in \mathbb{R}$ their scalar product and by $\mathbf{x} \wedge \mathbf{y} \in \mathbb{R}^3$ their cross-product. We also denote by $\|\mathbf{x}\| = (\mathbf{x} \cdot \mathbf{x})^{1/2}$ the Euclidean norm of \mathbf{x} . When \mathbf{x}, \mathbf{y} are non-zero, we further define their *projective distance* by

$$\text{dist}(\mathbf{x}, \mathbf{y}) = \frac{\|\mathbf{x} \wedge \mathbf{y}\|}{\|\mathbf{x}\| \|\mathbf{y}\|} = \sin(\angle(\mathbf{x}, \mathbf{y}))$$

where $\angle(\mathbf{x}, \mathbf{y})$ stands for the acute angle between the lines $\mathbb{R}\mathbf{x}$ and $\mathbb{R}\mathbf{y}$ spanned by \mathbf{x} and \mathbf{y} . This number depends only on the classes of \mathbf{x} and \mathbf{y} in $\mathbb{P}^2(\mathbb{R})$ and it can be shown that the induced function $\text{dist}: \mathbb{P}^2(\mathbb{R}) \times \mathbb{P}^2(\mathbb{R}) \rightarrow [0, 1]$ is a true distance function on $\mathbb{P}^2(\mathbb{R})$, namely that

$$\text{dist}(\mathbf{x}, \mathbf{z}) \leq \text{dist}(\mathbf{x}, \mathbf{y}) + \text{dist}(\mathbf{y}, \mathbf{z})$$

for any $\mathbf{x}, \mathbf{y}, \mathbf{z} \in \mathbb{R}^3 \setminus \{0\}$. For a point $\mathbf{x} \in \mathbb{R}^3 \setminus \{0\}$ and a set $S \subset \mathbb{R}^3 \setminus \{0\}$, we define

$$\text{dist}(\mathbf{x}, S) = \inf_{\mathbf{y} \in S} \text{dist}(\mathbf{x}, \mathbf{y}).$$

In [4], Schmidt proves Theorem A in a slightly more general form, essentially equivalent to the following.

Theorem B (Schmidt). *Let $\mathbf{u}, \mathbf{d} \in \mathbb{R}^3$ with $\mathbf{u} \cdot \mathbf{d} = 0$. Suppose that \mathbf{u} has \mathbb{Q} -linearly independent coordinates and that $\mathbf{d} \neq 0$. Then, for any $\delta > 0$ and any $\epsilon > 0$, there exists a non-zero point $\mathbf{x} \in \mathbb{Z}^3$ such that*

$$\text{dist}(\mathbf{x}, \mathbf{d}) \leq \delta \quad \text{and} \quad |\mathbf{x} \cdot \mathbf{u}| \leq \epsilon \|\mathbf{x}\|^{-\gamma}.$$

To recover Theorem A from Theorem B, it suffices to apply the latter to the points $\mathbf{u} = (1, \alpha, \beta)$ and $\mathbf{d} = (-\alpha - \beta, 1, 1)$ with δ fixed but small enough so that any non-zero point $\mathbf{x} \in \mathbb{Z}^3$ in the cone defined by $\text{dist}(\mathbf{x}, \mathbf{d}) \leq \delta$ has its last two coordinates of the same sign. Then, for \mathbf{x} as in Theorem B, the point $\pm \mathbf{x}$ provides a solution of the system in Theorem A with $X = \|\mathbf{x}\|$. Moreover, by letting ϵ go to 0, we can make X arbitrarily large.

Our main result is the following.

Theorem C. *Let $\psi: (1, \infty) \rightarrow (0, \infty)$ be an unbounded strictly increasing function, let \mathbf{x}_0 be a non-zero point of \mathbb{Z}^3 and let $\delta > 0$. Then, there exist linearly independent unit vectors $\mathbf{u}, \mathbf{v}, \mathbf{w}$ in \mathbb{R}^3 and positive constants C, C' with the following properties.*

- (i) *The coordinates of \mathbf{u} are linearly independent over \mathbb{Q} .*
- (ii) *We have $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w} = 0$, $\text{dist}(\mathbf{x}_0, \mathbf{v}) \leq \delta$, $\text{dist}(\mathbf{x}_0, \mathbf{w}) \leq \delta$.*
- (iii) *For each $X \geq 1$, there exists a non-zero point $\mathbf{x} \in \mathbb{Z}^3$ such that*

$$\|\mathbf{x}\| \leq X, \quad |\mathbf{x} \cdot \mathbf{u}| \leq \frac{C}{X^{\gamma+1}}, \quad \min\{|\mathbf{x} \cdot \mathbf{v}^\perp|, |\mathbf{x} \cdot \mathbf{w}^\perp|\} \leq \frac{C}{X^{\gamma+1}},$$

where $\mathbf{v}^\perp = \mathbf{u} \wedge \mathbf{v}$ and $\mathbf{w}^\perp = \mathbf{u} \wedge \mathbf{w}$.

- (iv) *For each $\mathbf{x} \in \mathbb{Z}^3$ with $\|\mathbf{x}\| \geq C'$, we have $|\mathbf{x} \cdot \mathbf{u}| \geq \frac{\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\})}{\psi(\|\mathbf{x}\|)\|\mathbf{x}\|^\gamma}$.*

The following corollary shows that the conclusion of Theorem B is best possible.

Corollary. *Let $\psi: (1, \infty) \rightarrow (0, \infty)$ be an unbounded strictly increasing function, let $\mathbf{d} \in \mathbb{R}^3 \setminus \{0\}$ and let $\delta > 0$. Then, there exists a unit vector $\mathbf{u} \in \mathbb{R}^3$ with \mathbb{Q} -linearly independent coordinates such that*

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{1}{\psi(\|\mathbf{x}\|)\|\mathbf{x}\|^\gamma}.$$

for any point $\mathbf{x} \in \mathbb{Z}^3$ of sufficiently large norm with $\text{dist}(\mathbf{x}, \mathbf{d}) > \delta$.

To derive the corollary from Theorem C, we simply choose a non-zero point $\mathbf{x}_0 \in \mathbb{Z}^3$ such that $\text{dist}(\mathbf{x}_0, \mathbf{d}) \leq \delta/3$ and we apply the theorem with δ replaced by $\delta/3$ and ψ replaced by $(\delta/3)\psi$. Then, with respect to the points \mathbf{u}, \mathbf{v} and \mathbf{w} provided by the theorem, any non-zero point \mathbf{x} of \mathbb{Z}^3 with $\text{dist}(\mathbf{x}, \mathbf{d}) \geq \delta$ has $\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\}) \geq \delta/3$ and so, if $\|\mathbf{x}\|$ is sufficiently large, we obtain

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{(\delta/3)}{(\delta/3)\psi(\|\mathbf{x}\|)\|\mathbf{x}\|^\gamma} = \frac{1}{\psi(\|\mathbf{x}\|)\|\mathbf{x}\|^\gamma},$$

as requested.

Schmidt's proof of Theorem B is short and clever. It is useful to go back to his argument to better understand the construction that leads to Theorem C. Here we simply give a short account of its first steps. Schmidt proceeds by contradiction, assuming that, for some positive δ and ϵ , any non-zero point $\mathbf{x} \in \mathbb{Z}^3$ satisfying

$$(1) \quad |\mathbf{x} \cdot \mathbf{u}| \leq \epsilon \|\mathbf{x}\|^{-\gamma}$$

has $\text{dist}(\mathbf{x}, \mathbf{d}) > \delta$. Then he constructs a sequence of rectangular parallelepipeds centered at the origin. Each of them has faces perpendicular to \mathbf{u}, \mathbf{d} and $\mathbf{u} \wedge \mathbf{d}$, and is particularly

elongated in the direction of the vector \mathbf{d} . It has volume 8 in order to ensure, by Minkowski's first convex body theorem, that it contains a non-zero integer point. Finally, its dimensions are chosen so that all of its points \mathbf{x} satisfy the condition (1). Then the non-zero integer points that it contains are all located in the narrow portion of the parallelepiped defined by $\text{dist}(\mathbf{x}, \mathbf{d}) > \delta$. From this, Schmidt deduces that, for each $X \geq 1$, there exists a non-zero point $\mathbf{x} \in \mathbb{Z}^3$ with $\|\mathbf{x}\| \leq X$ and $|\mathbf{x} \cdot \mathbf{u}| \leq CX^{-\gamma-1}$, where $C > 0$ is independent of X . This, in turn, implies the existence of a sequence of points $(\mathbf{x}_i)_{i \geq 1}$ in \mathbb{Z}^3 with increasing norms $X_i := \|\mathbf{x}_i\|$, such that $|\mathbf{x}_i \cdot \mathbf{u}| \leq CX_{i+1}^{-\gamma-1}$ for each $i \geq 1$. This second step is analogous to the construction of the so-called *minimal points* in [2]. The rest of the proof uses geometry of numbers to derive a contradiction out of these data.

To prove Theorem C, we construct a sequence of points $(\mathbf{x}_i)_{i \geq 1}$ in \mathbb{Z}^3 which satisfies the above property for a suitable unit vector $\mathbf{u} \in \mathbb{R}^3$. Moreover, for odd indices i , the class of \mathbf{x}_i in $\mathbb{P}^2(\mathbb{R})$ converges to that of a unit vector \mathbf{v} while, for even i , it converges to a different class belonging to a unit vector \mathbf{w} . In particular, the angle between \mathbf{x}_{i-1} and \mathbf{x}_i remains bounded away from 0. The construction of Moshchevitin in [1] also shares this property, and a similar behavior shows up in the study of extremal numbers (see [3, §4]). One difficulty is to make X_{i+1} arbitrarily large compared to X_i . We will see in the next section how it can be resolved.

Before going into this, we mention that the introduction of the vectors \mathbf{v}^\perp and \mathbf{w}^\perp in part (iii) of Theorem C is simply meant to make this statement more symmetric. The close relation between $\min\{|\mathbf{x} \cdot \mathbf{v}^\perp|, |\mathbf{x} \cdot \mathbf{w}^\perp|\}$ and $\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\})$ is clarified by the following estimates.

Lemma 2.1. *Let $\mathbf{u}, \mathbf{v}, \mathbf{w}$ be unit vectors in \mathbb{R}^3 with $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w} = 0$. Put $\mathbf{v}^\perp = \mathbf{u} \wedge \mathbf{v}$ and $\mathbf{w}^\perp = \mathbf{u} \wedge \mathbf{w}$. Then for any non-zero $\mathbf{x} \in \mathbb{R}^3$, we have*

$$\min\{|\mathbf{x} \cdot \mathbf{v}^\perp|, |\mathbf{x} \cdot \mathbf{w}^\perp|\} \leq \|\mathbf{x}\| \text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\}) \leq |\mathbf{x} \cdot \mathbf{u}| + \min\{|\mathbf{x} \cdot \mathbf{v}^\perp|, |\mathbf{x} \cdot \mathbf{w}^\perp|\}$$

Proof. We find that

$$|\mathbf{x} \cdot \mathbf{v}^\perp|^2 = |\det(\mathbf{x}, \mathbf{u}, \mathbf{v})|^2 = |(\mathbf{x} \wedge \mathbf{v}) \cdot \mathbf{u}|^2 = \|\mathbf{x} \wedge \mathbf{v}\|^2 - \|(\mathbf{x} \wedge \mathbf{v}) \wedge \mathbf{u}\|^2 = \|\mathbf{x} \wedge \mathbf{v}\|^2 - |\mathbf{x} \cdot \mathbf{u}|^2$$

since $(\mathbf{x} \wedge \mathbf{v}) \wedge \mathbf{u} = (\mathbf{x} \cdot \mathbf{u})\mathbf{v} - (\mathbf{v} \cdot \mathbf{u})\mathbf{x} = (\mathbf{x} \cdot \mathbf{u})\mathbf{v}$. As $\|\mathbf{x} \wedge \mathbf{v}\| = \|\mathbf{x}\| \text{dist}(\mathbf{x}, \mathbf{v})$, this gives

$$|\mathbf{x} \cdot \mathbf{v}^\perp| \leq \|\mathbf{x}\| \text{dist}(\mathbf{x}, \mathbf{v}) \leq |\mathbf{x} \cdot \mathbf{u}| + |\mathbf{x} \cdot \mathbf{v}^\perp|.$$

By symmetry, the same inequality holds with \mathbf{v} replaced by \mathbf{w} and \mathbf{v}^\perp replaced by \mathbf{w}^\perp . The conclusion follows. \square

3. THE RECURSIVE STEP

Our construction is based on the choice of a badly approximable number, by which we mean a real number α which, for an appropriate constant $C_1 > 1$, satisfies

$$(2) \quad |q\alpha - p| \geq \frac{1}{C_1|q|}$$

for each $p, q \in \mathbb{Z}$ with $q \neq 0$. We choose such a number α in the interval $(0, 1/2)$. Then, the theory of continued fractions provides sequences of integers $(p_n)_{n \geq 1}$, $(q_n)_{n \geq 1}$ such that, for each $n \geq 1$, we have

$$(3) \quad 0 \leq p_n \leq q_n, \quad p_1 = 0, \quad q_1 = 1,$$

$$(4) \quad q_n p_{n+1} - p_n q_{n+1} = (-1)^{n+1},$$

$$(5) \quad |q_n \alpha - p_n| < q_{n+1}^{-1},$$

$$(6) \quad q_n < q_{n+1} \leq C_1 q_n$$

(see [5, Chapter I]). The inequality $q_{n+1} \leq C_1 q_n$ follows by applying the hypothesis (2) to the left hand side of (5). For our purpose, we will simply need (3), (4), (6) and the following additional consequence of (2) and (5).

Lemma 3.1. *We have $|qp_n - pq_n| \geq \frac{q_n}{2C_1|q|}$ for any $p, q \in \mathbb{Z}$ with $1 \leq |q| < q_n$.*

Proof. If $|q| \leq q_n/\sqrt{2C_1}$, we find that

$$|qp_n - pq_n| \geq q_n|q\alpha - p| - |q||q_n\alpha - p_n| \geq \frac{q_n}{C_1|q|} - \frac{|q|}{q_{n+1}} \geq \frac{q_n}{2C_1|q|}.$$

Otherwise, we have $|qp_n - pq_n| \geq 1 \geq q_n/(2C_1|q|)$ because $qp_n - pq_n$ is a non-zero integer. This last assertion follows from the hypothesis $1 \leq |q| < q_n$ together with the fact that p_n and q_n are relatively prime because of (4). \square

We say that a point \mathbf{x} of \mathbb{Z}^3 is *primitive* if it is non-zero and has relatively prime coordinates. We say that a pair (\mathbf{x}, \mathbf{y}) of points of \mathbb{Z}^3 is *primitive* if it satisfies the following equivalent conditions:

- (i) $\mathbf{x} \wedge \mathbf{y}$ is a primitive point of \mathbb{Z}^3 ,
- (ii) (\mathbf{x}, \mathbf{y}) is a basis of $\mathbb{Z}^3 \cap \langle \mathbf{x}, \mathbf{y} \rangle_{\mathbb{R}}$,
- (iii) there exists $\mathbf{z} \in \mathbb{Z}^3$ such that $(\mathbf{x}, \mathbf{y}, \mathbf{z})$ is a basis of \mathbb{Z}^3 .

With this notation at hand, the next lemma provides the recursive step in our construction.

Lemma 3.2. *Let $(\mathbf{x}^*, \mathbf{x})$ be a primitive pair of points of \mathbb{Z}^3 , and let $Y, X' \in \mathbb{R}$ and $n \in \mathbb{Z}$ with $n \geq 2$ be such that*

$$(7) \quad 2(\|\mathbf{x}^*\| + \|\mathbf{x}\|) \leq Y \leq X' \quad \text{and} \quad q_{n-1} \leq \frac{2X'}{Y} < q_n.$$

Then there exist $\mathbf{y}, \mathbf{x}' \in \mathbb{Z}^3$ with the following properties:

1) $(\mathbf{x}^*, \mathbf{x}, \mathbf{y})$ is a basis of \mathbb{Z}^3 and $(\mathbf{x}, \mathbf{x}')$ is a primitive pair of \mathbb{Z}^3 with

$$\det(\mathbf{x}^*, \mathbf{x}, \mathbf{y}) = 1, \quad \det(\mathbf{x}^*, \mathbf{x}, \mathbf{x}') = q_n, \quad \det(\mathbf{y}, \mathbf{x}, \mathbf{x}') = -p_n;$$

2) $Y \leq \|\mathbf{y}\| \leq 2Y$ and $X' \leq \|\mathbf{x}'\| \leq 5C_1X'$;

$$3) \quad \text{dist}(\mathbf{x}^*, \mathbf{x}') \leq \frac{\|\mathbf{x}\|}{2X'} + \frac{2C_1}{Y\|\mathbf{x}^*\|\|\mathbf{x}\|\text{dist}(\mathbf{x}^*, \mathbf{x})};$$

4) the unit vector \mathbf{u} perpendicular to $\langle \mathbf{x}^*, \mathbf{x} \rangle_{\mathbb{R}}$ and the unit vector \mathbf{u}' perpendicular to $\langle \mathbf{x}, \mathbf{x}' \rangle_{\mathbb{R}}$ satisfy

$$\text{dist}(\mathbf{u}, \mathbf{u}') \leq \frac{2C_1}{Y\|\mathbf{x}^*\|\|\mathbf{x}\|\text{dist}(\mathbf{x}^*, \mathbf{x})\text{dist}(\mathbf{x}, \mathbf{x}')}.$$

Note that, in 4), the number $\text{dist}(\mathbf{u}, \mathbf{u}')$ is independent of the choice of \mathbf{u} and \mathbf{u}' .

Proof. Put $H = \|\mathbf{x}^* \wedge \mathbf{x}\|$ and $\mathbf{u} = H^{-1}\mathbf{x}^* \wedge \mathbf{x}$, so that \mathbf{u} is a unit vector orthogonal to $\langle \mathbf{x}^*, \mathbf{x} \rangle_{\mathbb{R}}$. By hypothesis, there exists $\mathbf{y}_0 \in \mathbb{Z}^3$ such that $(\mathbf{x}^*, \mathbf{x}, \mathbf{y}_0)$ is a basis of \mathbb{Z}^3 . Upon writing

$$\mathbf{y}_0 = r\mathbf{x}^* + s\mathbf{x} + t\mathbf{u}$$

with $r, s, t \in \mathbb{R}$, we find that

$$\pm 1 = \det(\mathbf{x}^*, \mathbf{x}, \mathbf{y}_0) = t \det(\mathbf{x}^*, \mathbf{x}, \mathbf{u}) = tH$$

and so $t = \pm H^{-1}$. Replacing \mathbf{y}_0 by $-\mathbf{y}_0$ if necessary, we may assume that $t = H^{-1}$. Then, replacing \mathbf{y}_0 by $\mathbf{y}_0 + \ell\mathbf{x}$ for a suitable $\ell \in \mathbb{Z}$, we may further assume that $|s| \leq 1/2$. We define

$$\mathbf{y} = \mathbf{y}_0 + a\mathbf{x}^* = (a+r)\mathbf{x}^* + s\mathbf{x} + H^{-1}\mathbf{u} \in \mathbb{Z}^3$$

where a is the smallest integer for which

$$(a+r)\|\mathbf{x}^*\| \geq Y + \frac{\|\mathbf{x}\|}{2} + 1.$$

Then, we have $\det(\mathbf{x}^*, \mathbf{x}, \mathbf{y}) = 1$ and

$$Y \leq \|\mathbf{y}\| \leq Y + \|\mathbf{x}^*\| + \|\mathbf{x}\| + 2 \leq 2Y$$

because $\|\mathbf{y} - (a+r)\mathbf{x}^*\| \leq |s|\|\mathbf{x}\| + H^{-1} \leq \|\mathbf{x}\|/2 + 1$.

We choose an integer m with $|sq_n + m| \leq 1/2$ and form the point

$$\mathbf{x}' = q_n \mathbf{y} + p_n \mathbf{x}^* + m \mathbf{x} \in \mathbb{Z}^3.$$

Since $\det(\mathbf{x}^*, \mathbf{x}, \mathbf{y}) = 1$, we find that

$$\det(\mathbf{x}^*, \mathbf{x}, \mathbf{x}') = q_n \quad \text{and} \quad \det(\mathbf{y}, \mathbf{x}, \mathbf{x}') = -p_n.$$

Since $\gcd(p_n, q_n) = 1$, this implies that $(\mathbf{x}, \mathbf{x}')$ is a primitive pair of points in \mathbb{Z}^3 . We further note that

$$\begin{aligned} \|\mathbf{x}' - q_n \mathbf{y}\| &\leq p_n \|\mathbf{x}^*\| + |m| \|\mathbf{x}\| \\ &\leq q_n \|\mathbf{x}^*\| + \frac{1}{2}(q_n + 1) \|\mathbf{x}\| \\ &\leq q_n (\|\mathbf{x}^*\| + \|\mathbf{x}\|) \\ &\leq \frac{1}{2} q_n Y, \end{aligned}$$

thus $(1/2)q_n Y \leq \|\mathbf{x}'\| \leq (5/2)q_n Y$. Since

$$\frac{2X'}{Y} \leq q_n \leq C_1 q_{n-1} \leq \frac{2C_1 X'}{Y},$$

we conclude that $X' \leq \|\mathbf{x}'\| \leq 5C_1 X'$. This proves 1) and 2).

To prove 3), we observe that

$$\begin{aligned} \|\mathbf{x}^* \wedge \mathbf{x}'\| &= \|\mathbf{x}^* \wedge (q_n \mathbf{y} + m \mathbf{x})\| \\ &= \|\mathbf{x}^* \wedge ((sq_n + m) \mathbf{x} + q_n H^{-1} \mathbf{u})\| \\ &\leq |sq_n + m| \|\mathbf{x}^* \wedge \mathbf{x}\| + q_n H^{-1} \|\mathbf{x}^* \wedge \mathbf{u}\| \\ &\leq \frac{1}{2} \|\mathbf{x}^*\| \|\mathbf{x}\| + \frac{2C_1 X'}{HY} \|\mathbf{x}^*\|, \end{aligned}$$

and so

$$\text{dist}(\mathbf{x}^*, \mathbf{x}') = \frac{\|\mathbf{x}^* \wedge \mathbf{x}'\|}{\|\mathbf{x}^*\| \|\mathbf{x}'\|} \leq \frac{\|\mathbf{x}^* \wedge \mathbf{x}'\|}{\|\mathbf{x}^*\| X'} \leq \frac{\|\mathbf{x}\|}{2X'} + \frac{2C_1}{HY}.$$

Then, 3) follows because $H = \|\mathbf{x}^*\| \|\mathbf{x}\| \text{dist}(\mathbf{x}^*, \mathbf{x})$.

Put $H' = \|\mathbf{x} \wedge \mathbf{x}'\|$ and $\mathbf{u}' = (H')^{-1} \mathbf{x} \wedge \mathbf{x}'$, so that \mathbf{u}' is a unit vector orthogonal to $\langle \mathbf{x}, \mathbf{x}' \rangle_{\mathbb{R}}$. We have

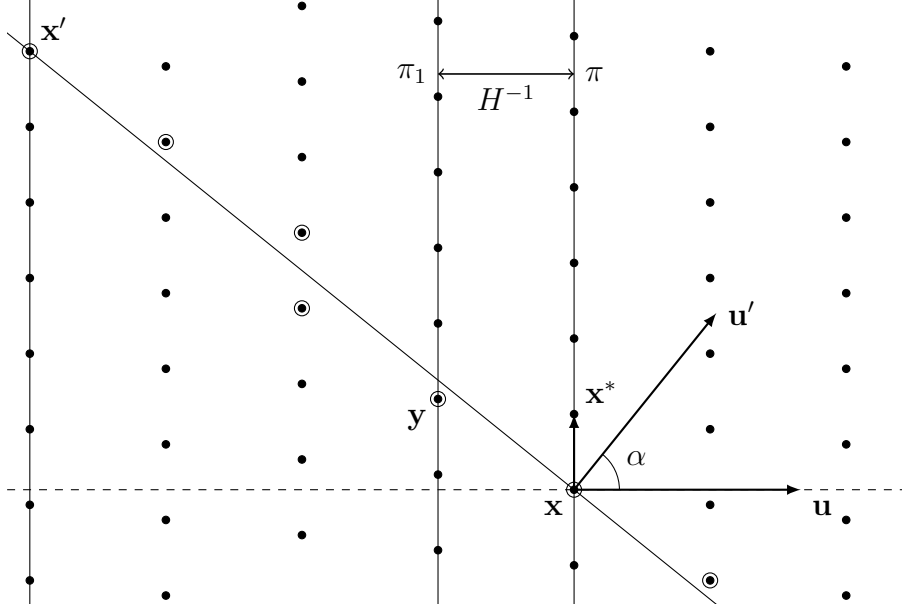

$$(\mathbf{x}^* \wedge \mathbf{x}) \wedge (\mathbf{x} \wedge \mathbf{x}') = \det(\mathbf{x}^*, \mathbf{x}, \mathbf{x}') \mathbf{x} = q_n \mathbf{x}$$

thus

$$\text{dist}(\mathbf{u}, \mathbf{u}') = \frac{q_n \|\mathbf{x}\|}{HH'} \leq \frac{2C_1 X' \|\mathbf{x}\|}{YHH'} \leq \frac{2C_1 \|\mathbf{x}\| \|\mathbf{x}'\|}{YHH'}.$$

This is equivalent to the estimate of 4) by definition of $\text{dist}(\mathbf{x}^*, \mathbf{x})$ and $\text{dist}(\mathbf{x}, \mathbf{x}')$. \square

The picture below illustrates the construction of the lemma. It shows the projection of \mathbb{Z}^3 on the plane perpendicular to \mathbf{x} , with the vector \mathbf{u} on the horizontal line passing through the origin. Each dot is thus the projection of a translate of $\mathbb{Z}\mathbf{x}$, and the vertical line passing through the origin represents the projection of the subspace $\pi = \langle \mathbf{x}^*, \mathbf{x} \rangle_{\mathbb{R}}$. The vertical line to its left is the projection of a closest plane π_1 containing an integral point, and its distance to π is H^{-1} .

The vector \mathbf{u}' is obtained by rotating \mathbf{u} by a small angle α about the line $\mathbb{R}\mathbf{x}$. Then, in each plane parallel to π , the integer points \mathbf{z} for which $|\mathbf{z} \cdot \mathbf{u}'|$ is minimal form at most two translates of $\mathbb{Z}\mathbf{x}$. They are shown on the picture as circled dots. The exact angle α is obtained through a process which is similar to that of fine tuning the focus of a microscope. A first coarse adjustment is to choose α so that, on π_1 , the minimal value for $|\mathbf{z} \cdot \mathbf{u}'|$ is obtained at $\mathbf{z} = \mathbf{y}$ or at $\mathbf{z} = \mathbf{y} + \mathbf{x}^*$ where \mathbf{y} is an integer point of π_1 of norm about Y which is essentially closest to the line $\mathbb{R}\mathbf{x}^*$. The finer adjustment consists in choosing α so that the plane perpendicular to \mathbf{u}' contains a non-zero integer point \mathbf{x}' of arbitrarily large norm (about X') also pointing in a direction close to that of \mathbf{x}^* . However, the most important feature of this correction, which is fundamental for the proof of Lemma 4.2 below, is that the minimal values for $|\mathbf{z} \cdot \mathbf{u}'|$ are essentially equidistributed as we move along the relevant planes parallel to π , from the one containing \mathbf{x}' to the one containing $-\mathbf{x}'$.

4. THE MAIN CONSTRUCTION

We now apply Lemma 3.2 to produce sequences of points of the sort that we need for the proof of Theorem C.

Lemma 4.1. *Let $(\mathbf{x}_0, \mathbf{x}_1)$ be a primitive pair of points in \mathbb{Z}^3 , and let $(X_i)_{i \geq 0}$ be a sequence of positive real numbers satisfying $X_0 = \|\mathbf{x}_0\|$, $X_1 = \|\mathbf{x}_1\|$ and*

$$(8) \quad 12C_1X_i \leq X_i^\gamma \leq X_{i+1}, \quad 2X_{i+1}^2 \leq X_iX_{i+2} \quad \text{for each } i \geq 1.$$

Suppose further that $5X_0 \leq X_1$ and that

$$(9) \quad \frac{5C_1X_1}{X_2} + \frac{4C_1}{\delta_0X_0X_1^{\gamma+1}} \leq \delta_0 \quad \text{where} \quad \delta_0 = \frac{1}{2}\text{dist}(\mathbf{x}_0, \mathbf{x}_1).$$

Then there exist linearly independent unit vectors \mathbf{u} , \mathbf{v} , \mathbf{w} in \mathbb{R}^3 and sequences $(\mathbf{x}_i)_{i \geq 2}$, $(\mathbf{y}_i)_{i \geq 1}$ in \mathbb{Z}^3 which, for each $i \geq 1$, satisfy the following properties:

1) *letting $n \geq 2$ denote the integer for which $q_{n-1} \leq 2X_{i+1}/X_i^\gamma < q_n$, we have*

$$\det(\mathbf{x}_{i-1}, \mathbf{x}_i, \mathbf{y}_i) = 1, \quad \det(\mathbf{x}_{i-1}, \mathbf{x}_i, \mathbf{x}_{i+1}) = q_n, \quad \det(\mathbf{y}_i, \mathbf{x}_i, \mathbf{x}_{i+1}) = -p_n;$$

2) *$X_i^\gamma \leq \|\mathbf{y}_i\| \leq 2X_i^\gamma$ and $X_{i+1} \leq \|\mathbf{x}_{i+1}\| \leq 5C_1X_{i+1}$;*

3) *$\text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_i) \geq \delta_0$ and*

$$\delta_0 \geq \frac{5C_1X_i}{X_{i+1}} + \frac{4C_1}{\delta_0X_{i-1}X_i^{\gamma+1}} \geq \begin{cases} \text{dist}(\mathbf{x}_{i-1}, \mathbf{v}) & \text{if } i \text{ is even,} \\ \text{dist}(\mathbf{x}_{i-1}, \mathbf{w}) & \text{if } i \text{ is odd;} \end{cases}$$

4) *the unit vector \mathbf{u}_i perpendicular to $\langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{R}}$ satisfies*

$$\text{dist}(\mathbf{u}_i, \mathbf{u}) \leq \frac{4C_1}{\delta_0^2X_{i-1}X_i^{\gamma+1}}.$$

Moreover, we have $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w} = 0$, $\text{dist}(\mathbf{x}_0, \mathbf{v}) \leq 3\delta_0$ and $\text{dist}(\mathbf{x}_0, \mathbf{w}) \leq \delta_0$.

Proof. Starting from the primitive pair $(\mathbf{x}_0, \mathbf{x}_1)$, Lemma 3.2 allows us to construct recursively pairs of vectors $(\mathbf{y}_1, \mathbf{x}_2), (\mathbf{y}_2, \mathbf{x}_3), \dots$ which for each $i \geq 1$ fulfill the conditions 1) and 2) of Lemma 4.1 as well as

$$3') \quad \text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_{i+1}) \leq \frac{5C_1X_i}{2X_{i+1}} + \frac{2C_1}{X_{i-1}X_i^{\gamma+1}\text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_i)},$$

$$4') \quad \text{dist}(\mathbf{u}_i, \mathbf{u}_{i+1}) \leq \frac{2C_1}{X_{i-1}X_i^{\gamma+1}\text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_i)\text{dist}(\mathbf{x}_i, \mathbf{x}_{i+1})}.$$

To construct $(\mathbf{y}_i, \mathbf{x}_{i+1})$ from the preceding pairs, we simply apply Lemma 3.2 with $\mathbf{x}^* = \mathbf{x}_{i-1}$, $\mathbf{x} = \mathbf{x}_i$, $Y = X_i^\gamma$ and $X' = X_{i+1}$. Then we define $\mathbf{y}_i = \mathbf{y}$ and $\mathbf{x}_{i+1} = \mathbf{x}'$. The lemma applies because, at each step the pair $(\mathbf{x}_{i-1}, \mathbf{x}_i)$ is primitive and

$$2(\|\mathbf{x}_{i-1}\| + \|\mathbf{x}_i\|) \leq 10C_1(X_{i-1} + X_i) \leq 12C_1X_i \leq X_i^\gamma \leq X_{i+1}.$$

Define

$$\delta_i := \frac{5C_1X_i}{2X_{i+1}} + \frac{2C_1}{\delta_0X_{i-1}X_i^{\gamma+1}} \quad \text{for each } i \geq 1.$$

Then the hypotheses (8) and (9) imply that $\delta_i \leq \delta_{i-1}/2$ for each $i \geq 1$. We claim that

$$(10) \quad \text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_i) \geq \delta_0 + \delta_{i-1} \quad \text{and} \quad \text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_{i+1}) \leq \delta_i \quad \text{for each } i \geq 1.$$

For $i = 1$, this is clear because $\text{dist}(\mathbf{x}_0, \mathbf{x}_1) = 2\delta_0$ and so 3') yields $\text{dist}(\mathbf{x}_0, \mathbf{x}_2) \leq \delta_1$. Moreover, if (10) holds for some $i \geq 1$, then

$$\text{dist}(\mathbf{x}_i, \mathbf{x}_{i+1}) \geq \text{dist}(\mathbf{x}_i, \mathbf{x}_{i-1}) - \text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_{i+1}) \geq \delta_0 + \delta_{i-1} - \delta_i \geq \delta_0 + \delta_i$$

and so 3') with i replaced by $i + 1$ yields $\text{dist}(\mathbf{x}_i, \mathbf{x}_{i+2}) \leq \delta_{i+1}$.

In view of the second part of (10), we conclude that, for even $i \geq 2$, the class of \mathbf{x}_{i-1} in $\mathbb{P}^2(\mathbb{R})$ converges to the class of a unit vector \mathbf{v} with

$$\text{dist}(\mathbf{x}_{i-1}, \mathbf{v}) \leq \sum_{j=0}^{\infty} \text{dist}(\mathbf{x}_{i+2j-1}, \mathbf{x}_{i+2j+1}) \leq \sum_{j=0}^{\infty} \delta_{i+2j} \leq 2\delta_i.$$

Similarly, for odd $i \geq 1$, the class of \mathbf{x}_{i-1} converges to the class of a unit vector \mathbf{w} with $\text{dist}(\mathbf{x}_{i-1}, \mathbf{w}) \leq 2\delta_i$. This proves 3) and implies in particular that $\text{dist}(\mathbf{x}_0, \mathbf{w}) \leq \delta_0$ and that

$$\text{dist}(\mathbf{x}_0, \mathbf{v}) \leq \text{dist}(\mathbf{x}_0, \mathbf{x}_1) + \text{dist}(\mathbf{x}_1, \mathbf{v}) \leq 3\delta_0.$$

The fact that $\text{dist}(\mathbf{x}_{i-1}, \mathbf{x}_i) \geq \delta_0$ for each $i \geq 1$ combined with 4') yields

$$\text{dist}(\mathbf{u}_i, \mathbf{u}_{i+1}) \leq \frac{2C_1}{\delta_0^2 X_{i-1} X_i^{\gamma+1}} \quad \text{for each } i \geq 1.$$

From this we conclude that the class of \mathbf{u}_i in $\mathbb{P}^2(\mathbb{R})$ converges to that of a unit vector $\mathbf{u} \in \mathbb{R}^3$ with

$$\text{dist}(\mathbf{u}_i, \mathbf{u}) \leq \frac{4C_1}{\delta_0^2 X_{i-1} X_i^{\gamma+1}} \quad \text{for each } i \geq 1.$$

This proves 4). Moreover, the relations $\mathbf{u}_i \cdot \mathbf{x}_i = 0$ ($i \geq 1$) imply by continuity that $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w} = 0$. \square

Lemma 4.2. *In the context of Lemma 4.1, suppose furthermore that*

$$(11) \quad X_{i+1} \geq X_{i-1} X_i^{\gamma+2} \quad \text{for each } i \geq 1.$$

If the product $\delta_0^2 X_1$ is larger than a suitable function of C_1 , then, for each index $i \geq 1$ and each $\mathbf{x} \in \mathbb{Z}^3$ with

$$(12) \quad \frac{X_i}{X_1} \leq \|\mathbf{x}\| < \frac{X_{i+1}}{X_1},$$

we have

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{1}{X_1^3 X_{i-1} \|\mathbf{x}\|^\gamma} \begin{cases} 1 & \text{if } \mathbf{x} \notin \langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{Z}}, \\ \text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\}) & \text{if } \mathbf{x} \in \langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{Z}}. \end{cases}$$

In the proof below, we use repeatedly the estimates 1), \dots , 4) of lemma 4.1. To alleviate the exposition, we simply refer to them as 1), \dots , 4) respectively. We also put a star on the right of an inequality sign to mean that this inequality holds when $\delta_0^2 X_1$ is sufficiently large, with a lower bound depending only on C_1 .

Proof. For any integer $j \geq 1$ and any $\mathbf{x} \in \mathbb{Z}^3$, we have

$$|\mathbf{x} \cdot \mathbf{u}_j| = \frac{|\det(\mathbf{x}, \mathbf{x}_{j-1}, \mathbf{x}_j)|}{\|\mathbf{x}_{j-1} \wedge \mathbf{x}_j\|} \geq \frac{|\det(\mathbf{x}, \mathbf{x}_{j-1}, \mathbf{x}_j)|}{\|\mathbf{x}_{j-1}\| \|\mathbf{x}_j\|} \geq \frac{|\det(\mathbf{x}, \mathbf{x}_{j-1}, \mathbf{x}_j)|}{(5C_1)^2 X_{j-1} X_j}$$

by 2) and the fact that $\|\mathbf{x}_i\| = X_i$ when $i \leq 1$. Since \mathbf{u}_j and \mathbf{u} are unit vectors, we also have

$$|\mathbf{x} \cdot (\mathbf{u}_j - \mathbf{u})| \leq \|\mathbf{x}\| \|\mathbf{u}_j - \mathbf{u}\| \leq 2\|\mathbf{x}\| \text{dist}(\mathbf{u}_j, \mathbf{u}) \leq \frac{8C_1 \|\mathbf{x}\|}{\delta_0^2 X_{j-1} X_j^{\gamma+1}}$$

by 4). Combining the last two estimates, we get

$$(13) \quad |\mathbf{x} \cdot \mathbf{u}| \geq |\mathbf{x} \cdot \mathbf{u}_j| - |\mathbf{x} \cdot (\mathbf{u}_j - \mathbf{u})| \geq \frac{|\det(\mathbf{x}, \mathbf{x}_{j-1}, \mathbf{x}_j)|}{(5C_1)^2 X_{j-1} X_j} - \frac{8C_1 \|\mathbf{x}\|}{\delta_0^2 X_{j-1} X_j^{\gamma+1}}.$$

Now, assume that \mathbf{x} satisfies the condition (12) for some $i \geq 1$. Since $(\mathbf{x}_{i-1}, \mathbf{x}_i, \mathbf{y}_i)$ is a basis of \mathbb{Z}^3 , we may write

$$(14) \quad \mathbf{x} = q\mathbf{y}_i + p\mathbf{x}_{i-1} + r\mathbf{x}_i$$

with $p, q, r \in \mathbb{Z}$. By 1), this yields

$$(15) \quad \det(\mathbf{x}, \mathbf{x}_{i-1}, \mathbf{x}_i) = q \det(\mathbf{x}_{i-1}, \mathbf{x}_i, \mathbf{y}_i) = q,$$

as well as

$$(16) \quad \det(\mathbf{x}, \mathbf{x}_i, \mathbf{x}_{i+1}) = q \det(\mathbf{y}_i, \mathbf{x}_i, \mathbf{x}_{i+1}) + p \det(\mathbf{x}_{i-1}, \mathbf{x}_i, \mathbf{x}_{i+1}) = -(qp_n - pq_n),$$

where $n \geq 2$ is the integer for which

$$(17) \quad q_{n-1} \leq \frac{2X_{i+1}}{X_i^\gamma} < q_n.$$

In the computations below, we use either (15) combined with (13) for $j = i$, or (16) combined with (13) for $j = i + 1$. We distinguish four cases.

Case 1. Suppose first that $\|q\mathbf{y}_i\| \geq C_2 \|\mathbf{x}\|$ where $C_2 = (8C_1)^3 / \delta_0^2$. Then, using the upper bound for $\|\mathbf{y}_i\|$ provided by 2), we find that

$$|q| = \frac{\|q\mathbf{y}_i\|}{\|\mathbf{y}_i\|} \geq \frac{C_2 \|\mathbf{x}\|}{2X_i^\gamma}.$$

Applying (13) with $j = i$, the above inequality combined with (15) yields

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{C_2 \|\mathbf{x}\|}{2(5C_1)^2 X_{i-1} X_i^{\gamma+1}} - \frac{8C_1 \|\mathbf{x}\|}{\delta_0^2 X_{i-1} X_i^{\gamma+1}} \geq \frac{2C_1 \|\mathbf{x}\|}{\delta_0^2 X_{i-1} X_i^{\gamma+1}}.$$

Using the hypothesis $X_i \leq X_1 \|\mathbf{x}\|$ to eliminate X_i from the last estimate, we conclude that

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{2C_1}{\delta_0^2 X_1^{\gamma+1} X_{i-1} \|\mathbf{x}\|^\gamma} \geq \frac{1}{X_1^3 X_{i-1} \|\mathbf{x}\|^\gamma}.$$

Case 2. Suppose now that $0 < \|q\mathbf{y}_i\| < C_2 \|\mathbf{x}\|$ where C_2 is as in Case 1. For the integer n defined by (17) we find, using 2), that

$$q_n \|\mathbf{y}_i\| \geq q_n X_i^\gamma \geq 2X_{i+1},$$

and thus

$$(18) \quad \frac{|q|}{q_n} = \frac{\|q\mathbf{y}_i\|}{q_n \|\mathbf{y}_i\|} < \frac{C_2 \|\mathbf{x}\|}{2X_{i+1}}.$$

Using $\|\mathbf{x}\| < X_1^{-1} X_{i+1}$, this gives

$$|q| < \frac{C_2}{2X_1} q_n \leq^* q_n.$$

Then, by Lemma 3.1, we conclude that

$$|qp_n - pq_n| \geq \frac{q_n}{2C_1 |q|} \geq \frac{X_{i+1}}{C_1 C_2 \|\mathbf{x}\|},$$

where the second estimate comes from (18). Applying (13) with $j = i + 1$, the above inequality combined with (16) yields

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{1}{C_3 X_i \|\mathbf{x}\|} - \frac{8C_1 \|\mathbf{x}\|}{\delta_0^2 X_i X_{i+1}^{\gamma+1}} \quad \text{where} \quad C_3 = 25C_1^3 C_2.$$

Using $X_{i+1} > X_1 \|\mathbf{x}\|$, this in turn yields

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{1}{C_3 X_i \|\mathbf{x}\|} - \frac{8C_1}{\delta_0^2 X_1^{\gamma+1} X_i \|\mathbf{x}\|^\gamma} \geq^* \frac{1}{2C_3 X_i \|\mathbf{x}\|}.$$

Finally, since $q \neq 0$, we have $C_2 \|\mathbf{x}\| > \|q\mathbf{y}_i\| \geq \|\mathbf{y}_i\| \geq X_i^\gamma$ by 2). Using this to eliminate X_i from the previous inequality, we conclude that

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{1}{2C_3 C_2^{1/\gamma} \|\mathbf{x}\|^\gamma} \geq^* \frac{1}{X_1^3 \|\mathbf{x}\|^\gamma}.$$

The above two cases cover the situation where $\mathbf{x} \notin \langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{Z}}$. The next two cases complete the proof of the lemma when $\mathbf{x} \in \langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{Z}}$.

Case 3. Suppose that $q = 0$ but $p \neq 0$. Then, the inequality (13) with $j = i + 1$ combined with (16) yields

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{|p|q_n}{(5C_1)^2 X_i X_{i+1}} - \frac{8C_1 \|\mathbf{x}\|}{\delta_0^2 X_i X_{i+1}^{\gamma+1}}.$$

Using the lower bound for q_n given by (17) and the hypothesis that $\|\mathbf{x}\| \leq X_1^{-1} X_{i+1}$, we deduce that

$$(19) \quad |\mathbf{x} \cdot \mathbf{u}| \geq \frac{2|p|}{(5C_1)^2 X_i^{\gamma+1}} - \frac{8C_1}{\delta_0^2 X_1 X_i X_{i+1}^\gamma} \geq^* \frac{|p|}{(5C_1)^2 X_i^{\gamma+1}}.$$

We also note that

$$\text{dist}(\mathbf{x}, \mathbf{x}_i) = \frac{\|\mathbf{x} \wedge \mathbf{x}_i\|}{\|\mathbf{x}\| \|\mathbf{x}_i\|} = \frac{|p| \|\mathbf{x}_{i-1} \wedge \mathbf{x}_i\|}{\|\mathbf{x}\| \|\mathbf{x}_i\|} \leq \frac{|p| \|\mathbf{x}_{i-1}\|}{\|\mathbf{x}\|} \leq \frac{5C_1 |p| X_{i-1}}{\|\mathbf{x}\|}$$

where the last step uses 2) and the fact that $\|\mathbf{x}_{i-1}\| = X_{i-1}$ when $i \leq 2$. Now, consider the main estimate of 3) with i replaced by $i + 1$. Applying the hypothesis (11) with i replaced by $i + 1$ to eliminate X_{i+2} , it gives

$$(20) \quad \text{dist}(\mathbf{x}_i, \{\mathbf{v}, \mathbf{w}\}) \leq \frac{5C_1 X_{i+1}}{X_{i+2}} + \frac{4C_1}{\delta_0 X_i X_{i+1}^{\gamma+1}} \leq \frac{9C_1}{\delta_0 X_i X_{i+1}^{\gamma+1}}.$$

Since $\|\mathbf{x}\| \leq X_1^{-1} X_{i+1}$, the latter two estimates yield

$$\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\}) \leq \text{dist}(\mathbf{x}, \mathbf{x}_i) + \text{dist}(\mathbf{x}_i, \{\mathbf{v}, \mathbf{w}\}) \leq^* \frac{6C_1 |p| X_{i-1}}{\|\mathbf{x}\|}.$$

We view this as a lower bound for $|p|$. Substituting it into (19) and then using $X_i \leq X_1 \|\mathbf{x}\|$ to eliminate X_i , we find

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\}) \|\mathbf{x}\|}{(6C_1)^3 X_{i-1} X_i^{\gamma+1}} \geq \frac{\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\})}{(6C_1)^3 X_1^{\gamma+1} X_{i-1} \|\mathbf{x}\|^\gamma} \geq^* \frac{\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\})}{X_1^3 X_{i-1} \|\mathbf{x}\|^\gamma}.$$

Case 4. Finally, suppose that $p = q = 0$. By 2) and (11), we have $\|\mathbf{x}_{i-1}\| \leq^* X_1 X_{i-1} \leq X_1^{-1} X_{i+1}$. Thus, the estimate (19) of Case 3 applies in particular to the choice of $\mathbf{x} = \mathbf{x}_{i-1}$ (corresponding to $p = 1$ and $q = r = 0$). This gives

$$|\mathbf{x}_{i-1} \cdot \mathbf{u}| \geq \frac{1}{(5C_1)^2 X_i^{\gamma+1}}.$$

In the present case, we have $\mathbf{x} = r\mathbf{x}_i$ with $r \neq 0$. Applying the above inequality with i replaced by $i + 1$ and then using 2), we thus find that

$$|\mathbf{x} \cdot \mathbf{u}| = |r\mathbf{x}_i \cdot \mathbf{u}| \geq \frac{|r|}{(5C_1)^2 X_{i+1}^{\gamma+1}} = \frac{\|\mathbf{x}\|}{(5C_1)^2 X_{i+1}^{\gamma+1} \|\mathbf{x}_i\|} \geq \frac{\|\mathbf{x}\|}{(5C_1)^3 X_i X_{i+1}^{\gamma+1}}.$$

By (20), we also have that

$$\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\}) = \text{dist}(\mathbf{x}_i, \{\mathbf{v}, \mathbf{w}\}) \leq \frac{9C_1}{\delta_0 X_i X_{i+1}^{\gamma+1}},$$

and so

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{\delta_0 \|\mathbf{x}\|}{(6C_1)^4} \text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\}) \geq^* \frac{\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\})}{X_1^3 X_{i-1} \|\mathbf{x}\|^\gamma}. \quad \square$$

5. PROOF OF THEOREM C

Without loss of generality, we may assume that \mathbf{x}_0 is primitive. Then, it belongs to a basis $(\mathbf{x}_0, \mathbf{x}'_0, \mathbf{x}''_0)$ of \mathbb{Z}^3 . Upon replacing \mathbf{x}'_0 by $\mathbf{x}'_0 + m\mathbf{x}_0$ for a sufficiently large positive integer m if necessary, we may further assume that $\text{dist}(\mathbf{x}_0, \mathbf{x}'_0) \leq \delta/2$. We define

$$(21) \quad \mathbf{x}_1 = n\mathbf{x}'_0 + \mathbf{x}_0, \quad X_0 = \|\mathbf{x}_0\|, \quad X_1 = \|\mathbf{x}_1\| \quad \text{and} \quad \delta_0 = \frac{1}{2} \text{dist}(\mathbf{x}_0, \mathbf{x}_1),$$

where n is a positive integer to be determined. Since

$$\lim_{n \rightarrow \infty} X_1 = \infty \quad \text{and} \quad \lim_{n \rightarrow \infty} \delta_0 = \frac{1}{2} \text{dist}(\mathbf{x}_0, \mathbf{x}'_0) \leq \frac{\delta}{4},$$

we can choose n so that the following conditions hold:

- $X_1 \geq \max\{5X_0, (12C_1)^\gamma\}$ and $\delta_0 \leq \delta/3$,
- the inequality (9) of Lemma 4.1 holds for any choice of X_2 with $X_2 \geq X_1^\gamma$,
- the product $\delta_0^2 X_1$ is larger than the function of C_1 involved in Lemma 4.2.

Then, for each $i \geq 1$, we choose recursively a value for X_{i+1} so that

$$X_{i+1} \geq X_{i-1} X_i^{\gamma+2} \quad \text{and} \quad \psi\left(\frac{X_{i+1}}{X_1}\right) \geq X_1^3 X_i.$$

This ensures that all the hypotheses of Lemmas 4.1 and 4.2 are satisfied. We claim that the vectors \mathbf{u} , \mathbf{v} and \mathbf{w} provided by Lemma 4.1 satisfy all the conditions of the theorem.

First of all, the last assertion of Lemma 4.1 together with the fact that $3\delta_0 \leq \delta$ implies that condition (ii) is fulfilled.

In order to verify condition (iii), we may restrict to the values of X with $X \geq 5C_1 X_0$. For such X , there exists a unique index $i \geq 1$ such that

$$5C_1 X_{i-1} \leq X < 5C_1 X_i.$$

Then the point $\mathbf{x} := \mathbf{x}_{i-1}$ has the required properties. It satisfies $\|\mathbf{x}_{i-1}\| \leq 5C_1 X_{i-1} \leq X$ and

$$|\mathbf{x}_{i-1} \cdot \mathbf{u}| = |\mathbf{x}_{i-1} \cdot (\mathbf{u} - \mathbf{u}_i)| \leq \|\mathbf{x}_{i-1}\| \|\mathbf{u} - \mathbf{u}_i\| \leq 2\|\mathbf{x}_{i-1}\| \text{dist}(\mathbf{u}_i, \mathbf{u}).$$

Using parts 2) and 4) of Lemma 4.1 together with the fact that $X_i \geq X/(5C_1)$, this becomes

$$|\mathbf{x}_{i-1} \cdot \mathbf{u}| \leq 2(5C_1 X_{i-1}) \frac{4C_1}{\delta_0^2 X_{i-1} X_i^{\gamma+1}} \leq \frac{C_4}{X^{\gamma+1}},$$

where $C_4 = (6C_1)^5 \delta_0^{-2}$. Combining part 3) of Lemma 4.1 with the hypothesis that $X_{i+1} \geq X_{i-1} X_i^{\gamma+2}$, we also find that

$$\text{dist}(\mathbf{x}_{i-1}, \{\mathbf{v}, \mathbf{w}\}) \leq \frac{5C_1 X_i}{X_{i+1}} + \frac{4C_1}{\delta_0 X_{i-1} X_i^{\gamma+1}} \leq \frac{9C_1}{\delta_0 X_{i-1} X_i^{\gamma+1}},$$

and thus, using Lemma 2.1, we obtain

$$\min\{|\mathbf{x}_{i-1} \cdot \mathbf{v}^\perp|, |\mathbf{x}_{i-1} \cdot \mathbf{w}^\perp|\} \leq \|\mathbf{x}_{i-1}\| \text{dist}(\mathbf{x}_{i-1}, \{\mathbf{v}, \mathbf{w}\}) \leq \frac{45C_1^2}{\delta_0 X_i^{\gamma+1}} \leq \frac{C_4}{X^{\gamma+1}}.$$

To prove condition (iv), choose an arbitrary $\mathbf{x} \in \mathbb{Z}^3$ with $\|\mathbf{x}\| \geq X_2/X_1$. Then, there exists an index $i \geq 2$ such that $X_1^{-1} X_i \leq \|\mathbf{x}\| < X_1^{-1} X_{i+1}$. By virtue of the choice of the sequence

$(X_i)_{i \geq 0}$, we have

$$\psi(\|\mathbf{x}\|) \geq \psi\left(\frac{X_i}{X_1}\right) \geq X_1^3 X_{i-1}$$

and so Lemma 4.2 gives

$$|\mathbf{x} \cdot \mathbf{u}| \geq \frac{\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\})}{X_1^3 X_{i-1} \|\mathbf{x}\|^\gamma} \geq \frac{\text{dist}(\mathbf{x}, \{\mathbf{v}, \mathbf{w}\})}{\psi(\|\mathbf{x}\|) \|\mathbf{x}\|^\gamma}.$$

This proves condition (iv) with $C' = X_2/X_1$.

Finally, to prove condition (i), suppose on the contrary that there exists a non-zero point $\mathbf{x} \in \mathbb{Z}^3$ such that $\mathbf{x} \cdot \mathbf{u} = 0$. For any sufficiently large index i , there is an integer multiple of \mathbf{x} with norm between X_i/X_1 and X_{i+1}/X_1 . Then Lemma 4.2 shows that $\mathbf{x} \in \langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{Q}}$ and so $\mathbf{x} \in \langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{Z}}$ because $(\mathbf{x}_{i-1}, \mathbf{x}_i)$ is a primitive pair. Since, by part 1) of Lemma 4.1, any triple $(\mathbf{x}_{i-1}, \mathbf{x}_i, \mathbf{x}_{i+1})$ is linearly independent, this implies that

$$\mathbf{x} \in \langle \mathbf{x}_{i-1}, \mathbf{x}_i \rangle_{\mathbb{Z}} \cap \langle \mathbf{x}_i, \mathbf{x}_{i+1} \rangle_{\mathbb{Z}} = \mathbb{Z}\mathbf{x}_i$$

for each large enough i , a contradiction.
